

**Table S2. Conceptual Coding Framework**

| Code                              | Definition                                                                                                                                                                                                                    | Analytic focus                                                                                                                                                                                                                                         | Key indicators                                                                              |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Policy process                    | Temporal dynamics through which health policies are formulated, adopted, implemented, reformed, or terminated, and the actors, ideas, and institutions shaping them over time.                                                | Agenda-setting and framing; formulation and coalition-building; implementation and instruments; policy change, learning, feedback, and diffusion; reform episodes.                                                                                     | agenda-setting; policy window; framing; reform; implementation; policy feedback; diffusion  |
| Governance & accountability       | Institutional arrangements and mechanisms through which health decisions are made, implemented, and held accountable; that is, how decisions are made rather than what is decided or when it changes.                         | Transparency; accountability and oversight; participation in routine decision-making; integrity and anti-corruption; administrative and stewardship capacity; multi-level coordination (TAPIC).                                                        | governance; regulation; oversight; accountability; coordination; stewardship capacity       |
| Interest group politics           | Conflict, negotiation, or competition among formally organized actors with material or professional stakes, with power treated as observable influence (Lukes’ first and second dimensions; pluralist tradition).             | Stakeholder bargaining and lobbying; professional jurisdiction; observable agenda-setting and non-decisions; elite influence and capture as actor behavior; veto players and gatekeeping.                                                              | lobbying; coalition; stakeholders; interest groups; capture; veto players                   |
| Social movements                  | Sustained collective challenges by less-institutionalized actors using contentious or rights- and identity-based action to shape health agendas, norms, or practices.                                                         | Health social movements; grassroots activism and protest; rights-based campaigns and framing; civil-society networks and collective identity; patient activism and contestation of biomedical authority.                                               | activism; mobilization; protest; advocacy; grassroots; collective identity                  |
| Critical power analysis           | Analysis treating power as a structural, ideological, or constitutive condition that shapes subjects, knowledge, and norms (Lukes’ third dimension; Marxist, Foucauldian, feminist, critical race and decolonial traditions). | Treats class, gender, race, coloniality, etc. as structures of power rather than descriptive variables, and analyzes how they produce subjects, knowledges, exclusions, or norms.                                                                      | hegemony; biopolitics; structural power; ideology; coloniality; intersectionality           |
| Political economy & welfare state | Distribution of economic resources, financing arrangements, welfare-state structures, and macroeconomic determinants shaping health, analyzed through empirical comparative-institutional lenses.                             | Health financing and resource allocation; welfare-state design and market and state relations; macro-structural determinants; distributional consequences and investment politics.                                                                     | financing; welfare state; redistribution; privatization; inequality; resource allocation    |
| Ethics & normative                | Normative argumentation about what is just, fair, legitimate, or morally required in health policy, systems, or practice (an evaluative or prescriptive register).                                                            | Treats justice, equity, rights, dignity, recognition, or autonomy as objects of argument and advances reasons for evaluating arrangements as just/unjust or legitimate/illegitimate.                                                                   | justice; equity; rights; legitimacy; dignity; recognition                                   |
| Other                             | The focal term is clearly conceptualized but the conceptualization does not fit any of the seven core categories.                                                                                                             | Primarily aesthetic, literary, or rhetorical registers; geopolitical or international-relations analyses outside the seven foci; behavioral or psychological treatments of “politics” as an individual attitude; empirical political-exposure studies. | residual; assigned only when an identifiable conceptualization does not fit a core category |
| Unclear                           | The focal term appears but its conceptualization cannot be reliably determined from the abstract.                                                                                                                             | Abstracts too brief to convey orientation; the term used without an articulated framework; multiple co-occurring conceptualizations with none identifiable as dominant.                                                                                | residual; reliability floor                                                                 |

**Note.** Categories represent analytically distinct dimensions of “politics” derived from public health and political science literatures. Coding was based on contextual interpretation of the focal term rather than keyword presence.
